Please first read: PTST, Perception Keys, Block Universe, Foundational Level

The original of this excerpt links to various other articles in book one of The Unity Trilogy. Since this is not possible here, the names of those articles are highlighted in yellow.

What the supernatural, the esoteric and the occult have in common is that they include many examples of extrasensory perception (ESP) in a wide variety of contexts and intentions. To understand how the universe functions, we need to formulate concepts which could plausibly explain how all these – at initial consideration different – types of ESP might be possible, might work. The fewer concepts the better, as fewer means that we are identifying basic facets of existence. See also ‚Occam‘s Razor' above.

I've identified three facets of the foundational level of existence which together can explain all the ESP phenomena which I've managed to either myself experience, or to gather from literature, and analyse:

1. **Energy** (bodies and structures). Every organism consists of two bodies – the material and the energetic, the latter consisting of the aura, chakras and meridians. The energy body is localised in space and time and bound to, or better part of, one organism. At death the energy body separates from the material body, the latter remaining as an inanimate husk. The phenomenon 'energy' also includes geomantic energies of the earth. I'm putting this first as it's probably the most generally familiar expression of the foundational level.
2. **Directional Perception**. This is my collective term for the directional perception of a person knowing which way to go, a dog finding its way home, or pigeons flying home etc. So here we're looking at a type of perception which – in all the examples known to me – happens in the now. So it's fully localised in time, and since it effectively provides a spatial vector, also (more or less) spatially local as well.
3. **PTST / MPTST**. Perception throughout space and time is, obviously, a non-localised phenomenen. It allows our perception to pick up information from anywhere in space and time. This is a huge assertion – and the reason that a large part of book one is concerned with demonstrating it.

These three facets of the foundational level are enough to explain all ESP. But there is a further facet of the foundational level without which our appreciation of it would be woefully incomplete: **Morphogenetic fields and Morphic information pools**. Life as we experience it would not be possible without these information pools – I'll be looking at them in some aspects in book two, and in more detail in book three. But since I by neccessity keep referring to them in many places, here a brief overview:

Morphogenetic fields and Morphic information pools

- **Morphic** means having a specific form or shape.
- **Morphogenesis** (from the Greek 'morphê' (shape) and 'genesis' (creation), literally, 'beginning of the shape') is the process that causes an organism to develop its shape. The process controls the organised spatial distribution of cells during the embryonic development of an organism.
- **Morphogenetic Field** means a field in which the information for organising the shape of an (embryonic or other) development is held. Morphogenetic fields have per se nothing to do with genes (DNA). They are species-specific and accumulate from all the previous organisms of the species.
- **Morphic resonance** means that a particular shape or structure is propagated via resonance with the morphogenetic field, whereby DNA and other elements of a fertilised egg serve as a starting structure, or morphogenetic germ, as the basis for resonance. The effect of the resonance is that an individual organism is influenced in the shape, or decisions, it takes by the relevant aspect of the prevailing morphogenetic field. Thus what happens depends on what has happened before.

In 1981 Rupert Sheldrake[i] published a book titled: 'A New Science of Life: The Hypothesis of Morphic Resonance'. Since then he has been a copious author and co-author of many books.[ii] I find his work pioneering, remarkable and inspiring, and for the most part rigorously researched, experimented for and convincing. My references to his work are thus also very copious in this trilogy.

Morphic resonance and morphogenetic fields in fact fit in very well with my own experience and the world view arising from it: **Morphogenetic fields are a sharing of information via PTST, whereby the species is the resonance key.** In this explanation they are not a field in the classical sense, and therefore could more appropriately be called something like 'morphogenetic species-specific information pool'. PTST provides the access, and the species the key.

- **Morphic information pools** is a term coined by myself, for two reasons. Firstly, I'm not happy with the word 'field' in this context, since for physicists the word normally implies

spatial extent or propagation. But in my understanding of the foundational level, informational connection (or universal entanglement) exists beneath the level of space-time and therefore spatial propagation is not required – connection simply is. Secondly, I specifically want to expand the scope of this type of morphic phenomenon beyond morphogenesis, for example to species-specific morphic social information pools and morphic technical information pools.
